

How to better understand SAR, interpret SAR products and realize the limitations

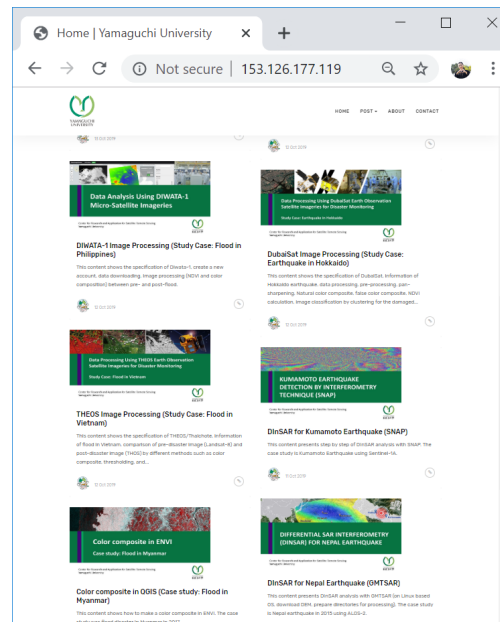

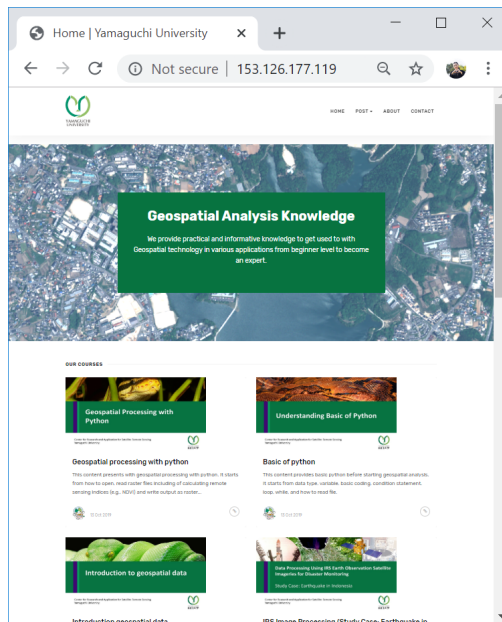

Nopphawan Tamkuan and Masahiko Nagai

Graduate School of Sciences and Technology of Innovation
Yamaguchi University, Japan

Yamaguchi University Resource (website)

- Collect materials and procedure how to analysis geospatial data especially for disaster application
- Implement to our students and university network to be able to join data analysis activity for emergency case

Real Aperture Radar (RAR)

Synthetic Aperture Radar (SAR) is side looking radar which utilizes flight path to **increase the antenna's size** (aperture) and **resolution in azimuth direction**.

This system uses complicated data processing of multi-temporal signals and phase receiving from targets to generate high resolution image.

Synthetic Aperture Radar (SAR)

• Sensor parameters

- Band
- Polarization
- Incidence angle
- Location of sensor
 - Azimuth
 - Look direction

Scattering mechanisms

- Specular Reflection
- Surface scattering
- Double bounce
- Volume scattering

• Surface parameter

- Topography
- Surface roughness
- Object geometry
- Dielectric constant

- Sensor parameters
 - Band
 - Polarization

Understand and Interpret SAR

Variety of SAR mechanism
at the same area

- Object geometry
- Dielectric constant

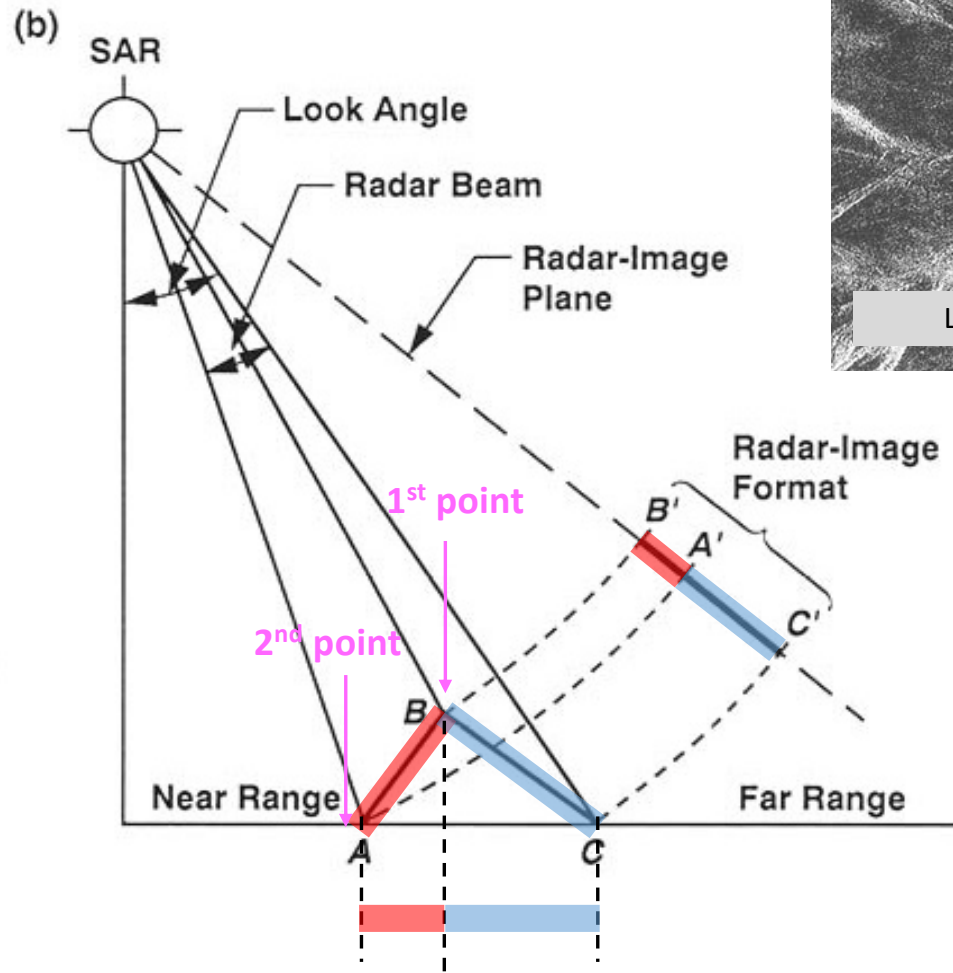

Radar image foreshortening

VAPs creation and limitations

Variety of SAR mechanism
at the same area

- Surface roughness
- Object geometry
- Dielectric constant

Limitations of SAR utilization for damage mapping

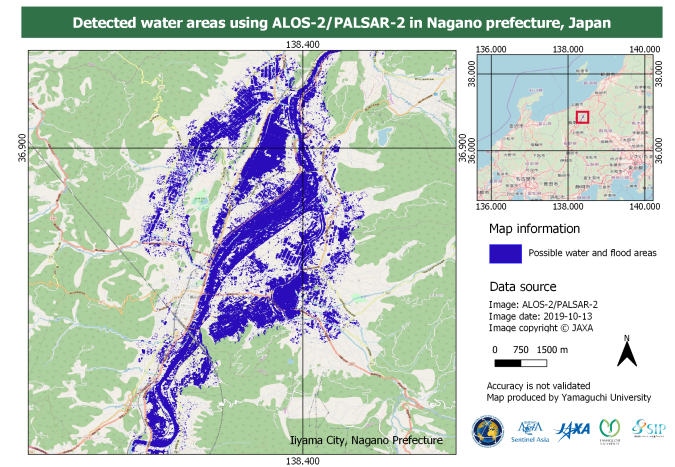

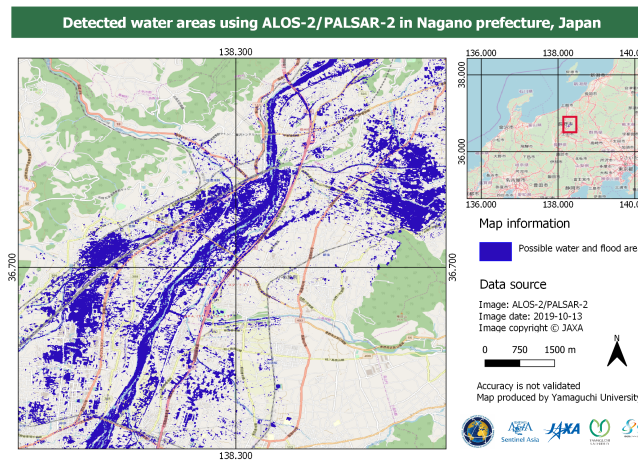

Flood

One SAR during flood
(Thresholding)

Discussions

- Include Permanent water
- Difficult for flood under vegetation and urban areas.
- Image change to be discrete value

Limitations of SAR utilization for damage mapping

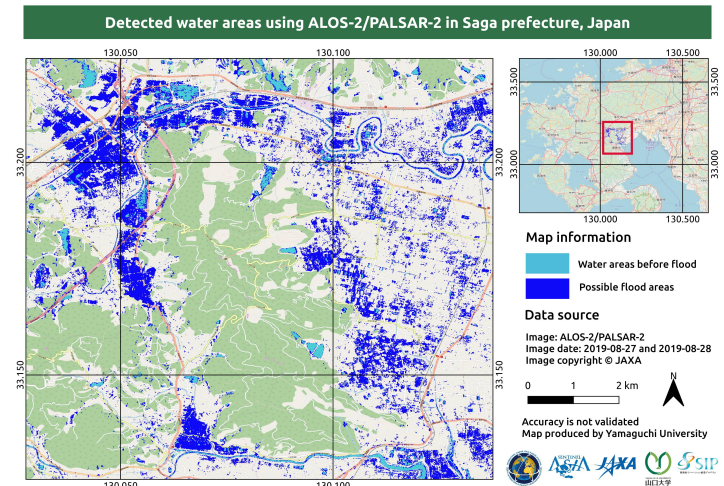

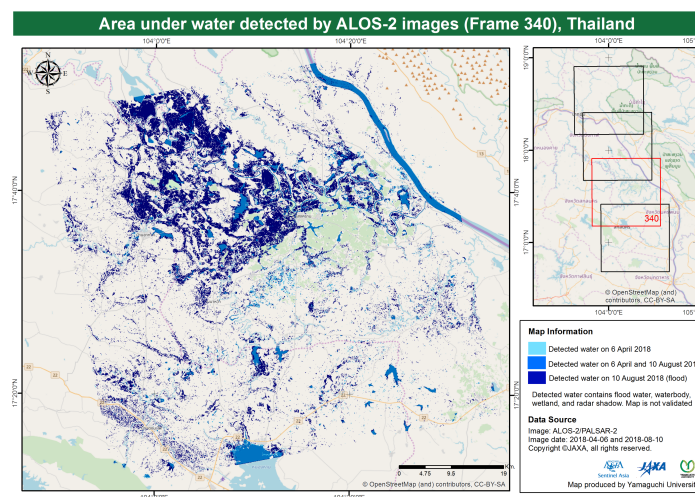

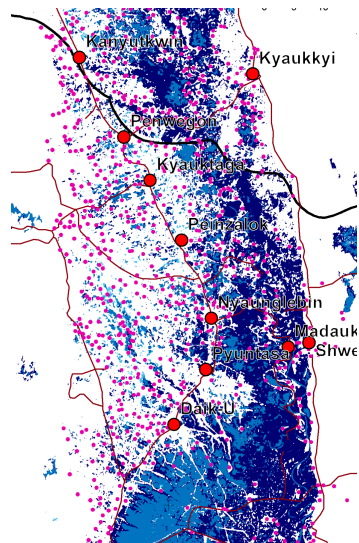

Flood

Discussions

- Better than just one image
- differentiate waterbody and seasonal water from flood
- Seasonal difference → difficult to compare
- Better to use 2 image near time or in the same season

Two image method
(Thresholding)

Limitations of SAR utilization for damage mapping

Flood

Two image method
(Color composite)

Discussions

- More gradient value → more information
- More difficult for interpretation
- Same SAR limitations
- Should consider seasonal effect of different time acquisition to interpretation

Before flood

Flood is red color

During flood

During flood

During flood

Flood is dark blue

During flood

Before flood

Limitations of SAR utilization for damage mapping

Landslide

Discussions

- Same SAR limitations
- More effect for geometry distortion

Two image method (needed)

Before landslide

After landslide

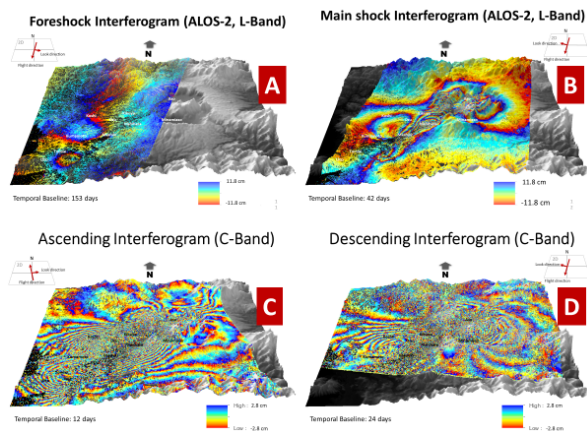

After landslide

Limitations of SAR utilization for damage mapping

Earthquake

Differential SAR Interferometry (DInSAR)

Discussions

- Fringes → Difficult to understand
- Just relative displacement
- Interferogram has many components. Not only surface deformation but also other effects such as atmospheric delay, topographic phase and noise.

=

L-band → 23 cm.

C-band → 5.6 cm.

How to read Interferogram

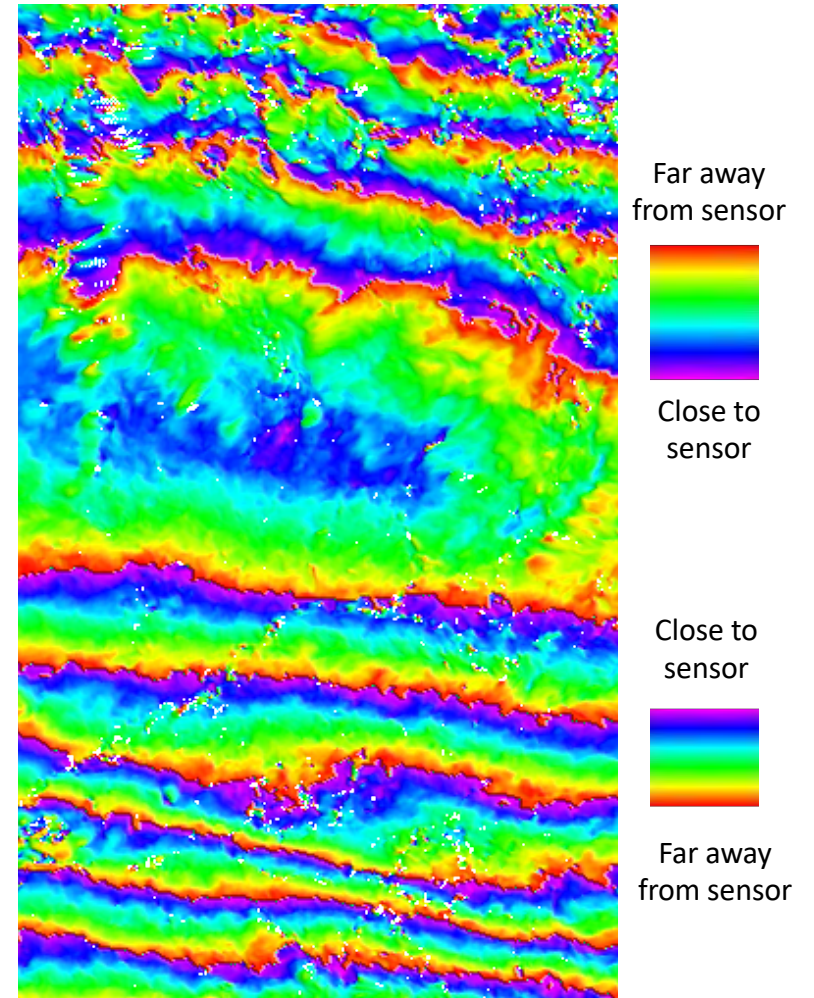

Before earthquake (subsidence)

**Kumamoto Earthquake
In 2016**

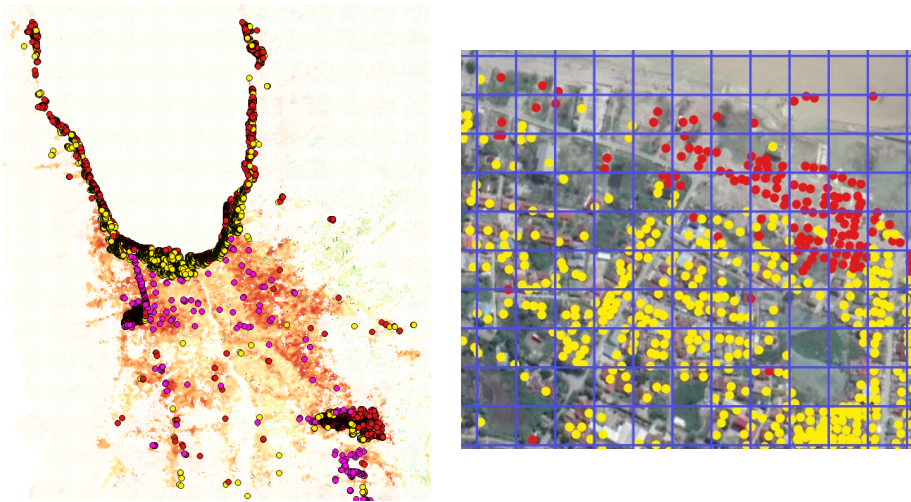

Fujiwara, S., Yarai, H., Kobayashi, T., Morishita, Y., Nakano, T., Miyahara, B., ... Une, H. (2016). Small-displacement linear surface ruptures of the 2016 Kumamoto earthquake sequence detected by ALOS-2 SAR interferometry. *Earth, Planets and Space*, 68(1), 160. <https://doi.org/10.1186/s40623-016-0534-x>

Limitations of SAR utilization for damage mapping

Earthquake

Interferometric coherence change

Discussions

- Need 2 image before and one after earthquake
- Show damage possibility
- Many decorrelation effects
 - Noise in the radar system and processing approach
 - geometric coherence proportional to the perpendicular component of the baseline
 - influence of temporal backscatter change, e.g. from surface cover change or vegetation
- No identify individual building but show as grid result

Phase based analysis
